Effect of Ocean Acidification on the Communications among Invertebrates Mediated by Plant-Produced Volatile Organic Compounds

Published On: December 30, 2016 | Pages: 012 - 018

Author(s): Valerio Zupo*, Mirko Mutalipassi, Patrick Fink and Marco Di Natale

Chemical communications among plant and animal components are fundamental elements for the functioning and the connectivity of ecosystems. In particular, wound-activated infochemicals trigger specific reactions of invertebrates according to evolutionary constraints, permitting them to identify prey cues, escape predators and optimize their behaviors according to s ...

Managing Large Herbivores in Protected Areas

Published On: August 17, 2016 | Pages: 001 - 011

Author(s): Rob Found*

By nature of their size, grouping behaviour, and central position within most trophic webs, large terrestrial herbivores -- namely ungulates and elephants -- tend to be both keystone and umbrella species. Their proportionately large impacts on ecosystems extend both top-down (i.e. regulation of vegetation), but also bottom up (regulated their predators). ...
